Power BI Dashboard Overview

OBJECTIVE

Give management one filterable view of sales, profit and the drivers behind them.

PRIMARY DECISIONS

- Where to invest for growth
- Which channels and SKUs to prioritize
- Where retention or geography needs action

EXPECTED USERS

Executives • Sales & channel leaders • Product/brand managers • Finance & BI

Power BI Dashboard Specification

Main features

KPI strip	Trend and channel	Product and geography	Data quality
Revenue, channel profit, distinct orders, and active customers.	Monthly revenue by channel and channel-profit comparison.	Contribution by product and revenue by region group.	Unmapped geography is retained rather than silently dropped.

Metric definitions and assumptions

Metric	Definition	Important assumption
Revenue	unitSold x stdPrice	One standard price per product; no discount field is supplied.
Gross profit	Revenue - unitSold x stdCost	Uses standard cost, not actual landed or fulfilment cost.
Channel profit	Gross profit - variable channel cost - allocated fixed channel cost	Contribution after case-specified channel cost; not full operating profit.
YoY	Jan-Sep 2012 vs Jan-Sep 2011	comparable nine-month periods.

How to read

Data-quality alert

352 of 998 customer-master records contain countries that do not match Country Master. Those transitions represent \$3.06M, or 39.7% of revenue. The dashboard labels them Unmapped; Fix the country master before using regional allocations for target-setting.

Growth accelerated; profitable acquisition is now the priority

The business has scale and positive contribution, but the next decision is where to invest without diluting margin.

CHANNEL PROFIT

RECOMMENDATION

Scale Online within a contribution-based CAC ceiling

- Preserve Direct for high-value account depth.
- Use Retail for reach with promotion and margin guardrails.
- Launch a segmented win-back for 232 customers lapsed more than 90 days.

Four levers concentrate the growth opportunity

Channel economics, customer value and SKU contribution point to a focused growth plan rather than broad expansion.

42.3%

Online margin

The most scalable acquisition channel. Set CAC limits against contribution, not revenue.

\$4.4k

Direct profit per customer

Protect high-value accounts with deeper service and retention activity.

232

Lapsed customers

Lapsed customers previously generated \$1.17M. Reactivating 10% could deliver \$65K within 90 days.

32%

Profit from two hero SKUs

Prioritize winning SKUs **Pure Soft 500ml** and **Super Soft 1L**; investigate **Detafast 800ml** pricing and cost-to-serve.

Sampling remains promising but not causal: samples cost \$72.8k and 75% of sampled customers buy within 90 days; add a control group before scaling.

Recommended Data Collection

Collect decision-ready data at the source, with consistent customer, product, geography and date keys.

Data to collect	Where to collect it	Information for business users
Retail sell-out & inventory	Retailer POS, distributors, e-commerce	True consumer demand, stockouts, sell-through and lost-sales risk
Prices, promotions & discounts	ERP, retailer systems, promotion calendars	Price elasticity, promotion effectiveness and incremental ROI
Customer identity & purchase history	CRM, loyalty, direct and online sales	Lifetime value, repeat purchase, churn and win-back targeting
Marketing exposure & digital behaviour	Ad platforms, website and e-commerce analytics	Attribution, conversion, CAC and customer-journey drop-offs
Samples, costs & master data	Sampling records, ERP, logistics, customer master	Sample lift, cost-to-serve, SKU profitability and reliable geography

90-DAY IMPLEMENTATION

0-30 DAYS

Fix country/channel masters; define metrics; add campaign, sample and order IDs.

31-60 DAYS

Integrate net sales, returns, fulfilment, inventory and sell-out; add quality monitoring.

61-90 DAYS

Launch CAC/ROAS, lapsed-customer cohorts, sample holdouts and margin experiments.
